

**AMENDMENTS TO THE CLAIMS**

Please **AMEND** claims 1, 3 and 8 as shown below.

Please **ADD** claim 13 as shown below.

The following is a complete list of all claims in this application.

1. (Currently Amended) A connector comprising:  
a housing having a through hole and a hanging projection formed on an inner bottom surface of the through hole; and  
a body portion inserted into the through hole, wherein the body portion is a single unit and divided into a plurality of integral portions comprising:  
a head portion having a hanging jaw formed on a bottom surface thereof and engaged with the hanging projection of the housing; and  
a connection portion extended from the head position and bent toward an inner top surface of the through hole; and  
a joint portion extended from the connection portion and connected to a power supply wire,  
wherein the bending of the connection portion and the engagement between the hanging jaw and the hanging projection push the head portion and the joint portion toward the inner top surface of the through hole to restrain movement of the body portion in the through hole.

2. (Previously Presented) The connector of claim 1, wherein the connection portion is bent at an angle of about 9 degrees to 10 degrees.

3. (Currently Amended) A backlight assembly lamp unit comprising:  
a lamp for generating a light;  
a power supply line having a first end is connected to the lamp; and  
a connector connected to a second end of the power supply line, wherein the connector comprises:  
a housing having a through hole and a hanging projection formed at an inner bottom surface of the through hole; and  
a body portion inserted into the through hole from one side opening of the through hole, and  
wherein the body portion is a single unit and divided into a plurality of integral portions comprising:  
a head portion having a hanging jaw engaged with the hanging projection of the housing; and  
a connection portion extended from the head portion and bent toward an inner top surface of the through hole; and  
a joint portion extended from the connection portion and connect to the second end of the power supply line,

wherein the bending of the connection portion and the engagement between the hanging jaw and the hanging projection push the head portion and the joint portion toward the inner top surface of the through hole to restrain movement of the body portion in the through hole.

4. (Previously Presented) The connector of claim 3, wherein the connection portion is bent at an angle of about 9 degrees to 10 degrees.

5. (Previously Presented) The backlight assembly lamp unit of claim 3, wherein a distance between the head portion and the inner bottom surface of the through hole is different from a distance between the joint portion and the inner bottom surface of the through hole and a distance between the connection portion and the inner bottom surface of the through hole.

6-7. (Cancelled)

8. (Currently Amended) A liquid crystal display (LCD) comprising:  
a lamp for generating light;  
a power supply line having a first end is connected to the lamp;  
a connector connected to a second end of the power supply line;  
a light guiding unit for guiding the light generated from the lamp; and  
a display unit for displaying an image in response to the light guided by the light guiding unit,  
wherein the connector comprises:

a housing having a through hole and a hanging projection formed at an inner bottom surface of the through hole; and

a body portion inserted into the through hole from one side opening of the through hole, for providing the external power to the lamp through the power supply line, and wherein the body portion is a single unit and divided into a plurality of integral portions comprising:

a head portion having a hanging jaw engaged with the hanging projection of the housing; and

a connection portion extended from the head portion and bent toward an inner upper surface of the housing; and

a joint portion extended from the connection portion and connected to the second end of the power supply line,

wherein the bending of the connection portion and the engagement between the hanging jaw and the hanging projection push the head portion and the joint portion toward the inner top surface of the through hole to restrain movement of the body portion in the through hole.

9. (Previously Presented) The LCD of claim 8, wherein the connection portion is bent at an angle of about 9 degrees to 10 degrees.

10. (Previously Presented) The LCD of claim 8, wherein a distance between the head portion and the inner bottom surface of the through hole is different from a distance between the

joint portion and the inner bottom surface of the through hole and a distance between the connection portion and the inner bottom surface of the through hole.

11-12. (Cancelled)

13. (New) A connector comprising:

a housing having a through hole and a hanging projection formed on an inner bottom surface of the through hole; and

a body portion inserted into the through hole, wherein the body portion is a single unit and divided into a plurality of integral portions comprising:

a head portion having a hanging jaw formed on a bottom surface thereof and engaged with the hanging projection of the housing; and

a connection portion extended from the head portion and bent toward an inner top surface of the through hole; and

a joint portion extended from the connection portion and connected to a power supply wire,

wherein the connection portion and joint portion configured to be closer to the inner top surface of the through hole than the head portion.
